EDUCATION

The University of British Columbia

Bachelor of Computer Science | AI Specialization

Expected May 2028

- **Relevant Coursework:** Software Construction, Computer Systems, Models of Computation

EXPERIENCE

Software Engineer Intern

May 2026 – August 2026

Xiamen Fanzhuo Information Technology Co.

Xiamen, China

- Contributed to **Java** and **Spring** backend services for an IoT monitoring platform supporting **1,000+** devices, collaborating cross-functionally with project managers, product managers, and business teams.
- Contributed to an **Apache Kafka**-backed ingestion flow for real-time sensor data, buffering high-frequency readings before database writes to reduce contention during simultaneous device updates.
- Implemented **Redis**-backed device-state caching, allowing **REST APIs** to return the latest reported status and remain responsive when edge devices were slow or offline.
- Built REST API endpoints for batch device onboarding, parsing Excel files and mapping device data to standardized JSON models for smart meters and building systems.
- Refactored backend components to remove duplication, simplify logic, and improve interfaces, using unit and integration tests to raise coverage to **90%** and validating changes through CI and pull-request reviews.

PROJECTS

BC Rental Agent | Python, FastAPI, Gemini API, ChromaDB, React, SQLite

- Built a Vancouver rental research agent with **Python**, **FastAPI**, and **Google Gemini** that evaluates Craigslist listings against user requirements, integrating the Google Maps API for commute constraints and Tavily API for listing research.
- Built a **RAG** system with **Gemini embeddings** and **ChromaDB** to support tenancy Q&A, lease review, and contract drafting, grounding outputs in the BC Residential Tenancy Act with citations to official sources.
- Built a three-stage screening pipeline combining deterministic filters, Gemini Flash classification, and deep agent research to prioritize relevant listings while limiting higher-cost LLM calls.

UBC Workday Enhancer | TypeScript, Manifest V3, Shadow DOM, Vite

- Built and launched a course-planning **Chrome extension** with 200+ active users, implementing visual schedules, calendar exports, and API-backed professor and grade data within UBC Workday.
- Integrated the RateMyProfessors and UBCGrades APIs through a Chrome background service worker, using message passing to handle permitted cross-origin requests.

FIRE Tracker | React, TypeScript, Vite, Supabase, PostgreSQL, Recharts

- Built a full-stack personal-finance planning product with **React**, **TypeScript**, **Supabase**, and **PostgreSQL**, enabling users to set retirement goals, compare four FIRE strategies, and track progress over time.
- Used **PostgreSQL** tables and database triggers to record transactions and automatically update account balances, keeping financial calculations consistent.
- Integrated Supabase Authentication with **PostgreSQL** Row-Level Security to enforce user-specific access across accounts and transactions, protecting financial data at the database layer.

TECHNICAL SKILLS

Languages & Frameworks: TypeScript/JavaScript, Python, C++, Java, HTML/CSS, React, Node.js, FastAPI, Express, Flask, Pydantic

Databases & Cloud: PostgreSQL, Supabase, SQLite, ChromaDB (Vector)

AI Development Tools: Claude, Codex, GitHub Copilot, Gemini, Devin/Windsurf

Computer Science: Data Structures, Algorithms

Developer Tools: Git, Docker, Vite, Playwright, Chrome Extension API, REST APIs
